Subject: NE LEAD Program

Good morning Anthony:

It was nice talking to you and others during your group's visit to EPA Region 7. Apologies for the slow response. I noted I hadn't gotten back to you as I was gathering up items in preparing to work from home.

During the meeting you had asked if we would expect the Agency to place similar restrictions on older dicamba products (such as those use on corn or other use sites) similar to what the Agency has placed on the new products used in over the top applications to cotton and soybeans.

When reevaluating existing uses, mitigation measures are developed through an evaluation that considers the particular use related incident data as a part of the that decision making process. The existing uses of dicamba would not necessarily be expected to result in the same types of incidents as the over-the-top cotton and soybean uses for various reasons (e.g. timing of application, etc.). As such, any resulting mitigation measures have the potential to differ as well. As the Agency continues its re-evaluation process for the older dicamba uses, any resulting changes in mitigation measures may not necessarily be the same as those for the newer products labeled for use on tolerant cotton and soybeans.

I hope this is helpful.

Jamie
